ULTRAPoint AVANCE

The tracker for hunting with marking bird retrieving dogs

The Ultrapoint Avance tracking system has a receiver which starts to vibrate and signal using a sound once the dog indicates a bird. There is no sound signal in the actual collar to disturb the dog at work. You are able to easily track the direction of the dog and can also estimate the distance to the dog.

Easy-to-use vibrating receiver:

- Indicates using both vibration and sound once the dog marks a bird.
- The tracker has both an automatic and a manual direction locator.
- No visible antennas.
- Sound regulation. Silent tracking function can be used.
- Exit for earpiece and built-in compass with luminous needle.
- Two channels with extra transmitter collar available as an accessory.

Waterproof transmitter collar:

- Latest technology provides excellent range and direction ability.
- There is no sound signal in the actual collar to disturb the dog at work.
- The antenna is located just above the dog's neck, so that the effect does not diminish as a result of being in contact with the dog's body.
- The transmitter is completely waterproof and works even when your dog goes swimming.
- The transmitter is powered by two lithium batteries (3.6V AA size). You can replace batteries easily yourself.
- Operates for approximately 600-800 hours.
- The collar sizes are 34-46 cm measured at the neck. The transmitter weighs only 140 g including the batteries.
